ACKNOWLEDGMENT

My express thanks and gratitude and thanks to Almighty God, my parents and other family members and friends without whose uncontained support, I could not have made this career in PGDCA.

I wish to place on my record my deep sense of gratitude to my project guide, **Mr. Darpan Parekh**, Developer Ruby Infotech for his constant motivation and valuable help through the project work. Express my gratitude to **Dr. Bharat Ratanpal**, Assistant Professor Department of Applied Mathematics, Faculty of Technology & Engineering for his valuable suggestions and advices throughout the Project. I also extend my thanks to other Faculties for their Cooperation during my project.

Finally, I would like to thank my friends for their cooperation to complete this project.

NAME OF STUDENTS

Hiren Patel

ABSTRACT

In Computer Shop Management very important feature used in e-commerce to assist people making purchases any products online & Book their Products & Pick Products from the Shop.

The business-to-consumer aspect of electronic commerce (e-commerce) is the most visible business use of the World Wide Web. The primary goal of an e-commerce site is to sell Products online.

E-commerce is fast gaining ground as an accepted and used business paradigm. More and more business houses are implementing web site providing functionality for performing commercial transactions over the web. It is reasonable to say that the process of shopping on the web is becoming common place.

This project deals with developing an e-commerce website for online different types of Products. It provides the user with a catalog of different types of Products available for purchase in the store. In order to facilitate online purchase a shopping cart is provided to the user. Customers can Shop the Items online and pick the products from nearest shop. The system is implemented using a 3-tier approach, with a backend database, a middle tier ASP.NET, and a web browser as the front-end client.

The **Computer Shop Management** project has been developed to allow business grows larger and faster. This site will let customers to view and order products online from any part of City. The site sells different types of Products.

The **Computer Shop Management** is expanded permanently through new products in order to offer a product portfolio corresponding to the market. Target groups of Customer of the **Computer Shop Management** are huge. The customers can have a payment option through PayPal & Make payment at the shop also.

Users of the system: Customer is the user of the system. An administrator of the website is the super user. When the user types in the URL of the website, a Welcome page is shown which has a menu on the left-hand side, a banner at the top and any related links to other sites. This site contains an online catalog for the user. User has to login to Welcome Page before ordering anything. Login functionality should check the authenticity of the user from the database.

Functional components of the project: Following is a list of functionalities of the system:

- **Registration Screen:** If the user is not registered, then registration screen should be available
- **Products:** This screen will show the different types of product with their Features. On selecting any one of the Product, user is shown the columns for the quantity to be entered. After entering the quantity, price is automatically set by the system based on the product price data.
- **Contact Information** – Contact information regarding the Shop addresses with phones are provided on this screen

In order to develop an e-commerce website, a number of Technologies must be studied and understood. These include multi-tiered architecture, server and client-side scripting techniques, implementation technologies such as ASP.NET, programming language (such as C#), relational databases (such as SQL).

This is a project with the objective to develop a basic website where a consumer is provided with a Computer Shop Management application and also to know about the technologies used to develop such an application.

This document will discuss each of the underlying technologies to create and implement a website.

Chapter 1

INTRODUCTION

1.1. INTRODUCTION TO PROJECT

E-commerce is fast gaining ground as an accepted and used business. More and more business houses are implementing web sites providing functionality for performing commercial transactions over the web. It is reasonable to say that the process of shopping on the web is becoming common place.

The objective of this project is to develop a general-purpose e-commerce store where any product can be bought from the comfort of home through the Internet & for those customers who also want to see the product Physically so they can book the product online and pick the products from the nearest shop. For those customers who don't trust on the online shop only and wants to touch the physical product and then only purchase.

The **Computer Shop Management** is a virtual store on the Internet where customers can browse the catalog and select products of interest. The selected items may be collected in a shopping cart. At checkout time, the items in the shopping cart will be presented as an order. At that time, more information will be needed to complete the transaction.

Electronic Commerce (e-commerce) applications support the interaction between different parties participating in a commerce transaction via the network, as well as the management of the data involved in the process.

1.2. PURPOSE OF THE PROJECT

The **Computer Shop Management** needs to sell different types of products to customer living in any part city. The website will show all products in categorized manner. Customer can browse any product for its price and other details and they can book the product & Pick the Products from the Shop. Products can be managed by operators from admin panel. Operator can be created by admin. Admin can keep track of orders through admin panel.

The main purpose of the system is to enable customers to browse and order from any part of the City and hence increasing business scope & will Save the time for both customer and shop keeper.

1.3. PROBLEM IN EXISTING SYSTEM

- The existing system is manual system. Needs to be converted into automated system.
- Risk of mismanagement of data.
- Less Security.
- No proper coordination between different Applications and Users.
- Fewer Users.
- Not in reach of distant users.

1.4. SOLUTION OF THESE PROBLEMS

The development of the new system contains the following activities, which try to automate the entire process keeping in view of the database integration approach.

1. User friendliness is provided in the application with various controls.
2. The system makes the overall project management much easier and flexible.
3. There is no risk of data mismanagement at any level while the project development is under process.
4. It provides high level of security with different level of authentication.
5. Users from any part of the city can make use of the system.
6. New system will be much better in performance as compared to existing one & Saves the time and efforts for both.

Chapter 2

SYSTEM ANALYSIS

2.1. INTRODUCTION

After analyzing the requirements of the task to be performed, the next step is to analyze the problem and understand its context. The first activity in the phase is studying the existing system and other is to understand the requirements and domain of the new system. Both the activities are equally important, but the first activity serves as a basis of giving the functional specifications and then successful design of the proposed system. Understanding the properties and requirements of a new system is more difficult and requires creative thinking and understanding of existing running system is also difficult, improper understanding of present system can lead diversion from solution.

2.2. ANALYSIS MODEL

First of all the feasibility study is done. Once that part is over the requirement analysis and project planning begins. If system exists one and modification and addition of new module is needed, analysis of present system can be used as basic model.

The design starts after the requirement analysis is complete and the coding begins after the design is complete. Once the programming is completed, the testing is done. In this model the sequence of activities performed in a software development project are: -

- Requirement Analysis
- Project Planning
- System design
- Detail design
- Coding
- Unit testing

2.3. STUDY OF THE SYSTEM

GUI'S

The GUI'S at the top level have been categorized as

1. Admin side interface
2. Customer side interface

The Admin side interface concentrates on the activities which needs proper authentication, Data insertion, Data deletion and Date updation.

Customer side interface helps the users to search the desired products and book the product.

NUMBER OF MODULES

The system after careful analysis has been identified to be presented with the following modules:

This project is divided into 9 modules:

1. Registration Module (Admin & user)
2. Login Module (Admin & user)
3. Products Module
4. Shopping cart Module
5. Report Module
6. Whole Seller Product Module
7. Admin User Management Module
8. Admin Catalog Management Module
9. Admin Order Management Module

Entities Involved in the Project:

- 1) Customer
- 2) Product
- 3) Admin

Customer: The target user of the system. A Customer is responsible for registering them to the site, browsing site, Book the Product.

Product: Product is the entity, a customer looking for. A Product will be sold to the customer.

Admin: An entity responsible for managing users, roles and roles privileges.

2.4. HARDWARE SPECIFICATIONS

HARDWARE REQUIREMENTS:

- i3 2.00 GHz Processor and Above
- RAM 512MB and Above
- HDD 20 GB Hard Disk Space and Above

SOFTWARE REQUIREMENTS:

- WINDOWS OS (XP /7/8/10)
- Visual Studio .Net 2010
- SQL Server 2008

2.5. PROPOSED SYSTEM

We all know the importance of computerization. The world is moving ahead at lightening speed and every one is running short of time. One always wants to get the information and perform a task he/she/they desire(s) within a short period of time and too with amount of efficiency and accuracy. The application areas for the computerization have been selected on the basis of following factors:

- Minimizing the manual records kept at different locations.
- There will be more data integrity.

Project Report

- Facilitating desired information display, very quickly, by retrieving information from users.
- Facilitating various statistical information which helps in decision-making
- To reduce manual efforts in activities that involved repetitive work.
- Updating and deletion of such a huge amount of data will become easier.

2.6. INPUT AND OUTPUT

The main inputs, outputs and major functions of the system are as follows

INPUTS:

- Customer enters his or her user id and password.
- Admin enter his or her user id and password.
- User requests the product description.
- User requests the product search.
- User Book the product.

OUTPUTS:

- Admin receives order details.
- Users receive requested product details.
- Users receive products from the shop.

Chapter 3

Feasibility Report

Preliminary investigation examines project feasibility, the likelihood the system will be useful to the organization. The main objective of the feasibility study is to test the Technical, Operational and Economical feasibility for adding new modules and debugging old running system. All system is feasible if they are unlimited resources and infinite time. There are aspects in the feasibility study portion of the preliminary investigation:

- Technical Feasibility
- Operation Feasibility
- Economical Feasibility

3.1. Technical Feasibility

The technical issue usually raised during the feasibility stage of the investigation includes the following:

- Does the necessary technology exist to do what is suggested?
- Do the proposed equipments have the technical capacity to hold the data required to use the new system?
- Will the proposed system provide adequate response to inquiries, regardless of the number or location of users?
- Can the system be upgraded if developed?
- Are there technical guarantees of accuracy, reliability, ease of access and data security?

Earlier no system existed to cater to the needs of 'Secure Infrastructure Implementation System'. The current system developed is technically feasible. It is a web-based user interface for audit workflow. Thus, it provides an easy access to the users. The database's purpose is to create, establish and maintain a workflow among various entities in order to facilitate all concerned users in their various capacities or roles. Permission to the users would be granted based on the

roles specified. Therefore, it provides the technical guarantee of accuracy, reliability and security.

3.2. Operational Feasibility

Proposed projects are beneficial only if they can be turned out into information system. That will meet the organization's operating requirements. Operational feasibility aspects of the project are to be taken as an important part of the project implementation. Some of the important issues raised are to test the operational feasibility of a project includes the following: -

- Is there sufficient support for the management from the users?
- Will the system be used and work properly if it is being developed and implemented?
- Will there be any resistance from the user that will undermine the possible application benefits?

This system is targeted to be in accordance with the above-mentioned issues. Beforehand, the management issues and user requirements have been taken into consideration. So there is no question of resistance from the users that can undermine the possible application benefits.

The well-planned design would ensure the optimal utilization of the computer resources and would help in the improvement of performance status.

3.3. Economic Feasibility

A system can be developed technically and that will be used if installed must still be a good investment for the organization. In the economical feasibility, the development cost in creating the system is evaluated against the ultimate benefit derived from the new systems. Financial benefits must equal or exceed the costs.

The system is economically feasible. It does not require any addition hardware or software. Since the interface for this system is developed using the existing resources and technologies available, There is nominal expenditure and economical feasibility for certain.

Chapter 4

SOFTWARE REQUIREMENT SPECIFICATION

INTRODUCTION

Purpose: The main purpose for preparing this document is to give a general insight into the analysis and requirements of the existing system or situation and for determining the operating characteristics of the system.

Scope: This Document plays a vital role in the development life cycle (SDLC) and it describes the complete requirement of the system. It is meant for use by the developers and will be the basic during testing phase. Any changes made to the requirements in the future will have to go through formal change approval process.

DEVELOPERS RESPONSIBILITIES OVERVIEW:

The developer is responsible for:

- Developing the system, which meets the SRS (software requirements specification) and solving all the requirements of the system?
- Demonstrating the system and installing the system at client's location after the acceptance testing is successful.
- Submitting the required user manual describing the system interfaces to work on it and also the documents of the system.
- Conducting any user training that might be needed for using the system.
- Maintaining the system for a period of one year after installation.

4.1. FUNCTIONAL REQUIREMENTS:

OUTPUT DESIGN

Outputs from computer systems are required primarily to communicate the results of processing to users. They are also used to provide a permanent copy of the results for later consultation. The various types of outputs in general are:

INPUT DESIGN

Input design is a part of overall system design. The main objective during the input design is as given below:

Project Report

- To produce a cost-effective method of input.
- To achieve the highest possible level of accuracy.
- To ensure that the input is acceptable and understood by the user.

INPUT STAGES:

The main input stages can be listed as below:

- Data recording
- Data transcription
- Data conversion
- Data verification
- Data control
- Data transmission
- Data validation
- Data correction

INPUT TYPES:

It is necessary to determine the various types of inputs. Inputs can be categorized as follows:

- External inputs, which are prime inputs for the system.
- Internal inputs, which are user communications with the system.
- Operational, which are computer department's communications to the system?
- Interactive, which are inputs entered during a dialogue.

DATA VALIDATION

Procedures are designed to detect errors in data at a lower level of detail. Data validations have been included in the system in almost every area where there is a possibility for the user to commit errors. The system will not accept invalid data. Whenever an invalid data is keyed in, the system immediately prompts the user and the user has to again key in the data and the system will accept the data only if the data is correct. Validations have been included where necessary.

The system is designed to be a user friendly one. In other words the system has been designed to communicate effectively with the user. The system has been designed with pop up menus.

4.2. Other Nonfunctional Requirements

Performance Requirements - As it is going to be used by all the concerned employees within the organization, the system should have a good performance in terms of speed and accuracy. The proposed system should be accurate and fast enough to handle huge data. It should provide fast communication between server and clients.

Safety Requirements – As the system is going to handle records for a long run eliminating the manual system, it is supposed to ensure the retaining of data avoiding or eliminating any probable cause for data loss.

Security Requirements – The software should not allow unauthorized access to any module of the system. Besides, it should maintain the privileges granted to users at various user levels.

Chapter 5

SYSTEM DESIGN

5.1. INTRODUCTION

Design is the first step in the development phase for any engineered product or system. The designer's goal is to produce a model or representation of an entity that will later be built. Beginning, once system requirement have been specified and analyzed, system design is the first of the three technical activities -design, code and test that is required to build and verify software.

5.2. SYSTEM WORKFLOW

5.3 NORMALIZATION

It is a process of converting a relation to a standard form. The process is used to handle the problems that can arise due to data redundancy i.e. repetition of data in the database, maintain data integrity as well as handling problems that can arise due to insertion, updation, deletion anomalies.

Decomposing is the process of splitting relations into multiple relations to eliminate anomalies and maintain data integrity. To do this we use normal forms or rules for structuring relation.

Insertion anomaly: Inability to add data to the database due to absence of other data.

Deletion anomaly: Unintended loss of data due to deletion of other data.

Update anomaly: Data inconsistency resulting from data redundancy and partial update

Normal Forms: These are the rules for structuring relations that eliminate anomalies.

FIRST NORMAL FORM:

A relation is said to be in first normal form if the values in the relation are atomic for every attribute in the relation. By this we mean simply that no attribute value can be a set of values or, as it is sometimes expressed, a repeating group.

SECOND NORMAL FORM:

A relation is said to be in second Normal form if it is in first normal form and it should satisfy any one of the following rules.

- 1) Primary key is not a composite primary key
- 2) No non key attributes are present
- 3) Every non key attribute is fully functionally dependent on full set of primary key.

THIRD NORMAL FORM:

A relation is said to be in third normal form if there exists no transitive dependencies.

Transitive Dependency: If two non key attributes depend on each other as well as on the primary key then they are said to be transitively dependent.

The above normalization principles were applied to decompose the data in multiple tables thereby making the data to be maintained in a consistent state.

5.4. E – R DIAGRAMS

5.5. Unified Modeling Language Diagrams

ACTIVITY DIAGRAMS

Use case diagram:

Use case scenario

Basic Flow:

1. Customer wants to buy the product.
2. Customer search Product in catalogue.
3. Customer checks whether the Product is available.
4. Customer add the product in the cart.
5. Customer place the order or Book Product.
6. Admin confirm the order if the product is available.
7. Admin provides order id and address for pickup point and delivery time.
8. Admin Generate the Bill.
9. Customer pick the item from the shop.
10. Use case Ends.

Alternative Flow for step 3 (a): Product is not available.

User is notified.

Use case ends

Chapter 7

CONCLUSION

Project Report

The Internet has become a major resource in modern business, thus electronic shopping has gained significance not only from the entrepreneur's but also from the customer's point of view. For the entrepreneur, electronic shopping generates new business opportunities and for the customer, it makes comparative shopping possible. As per a survey, most consumers of online stores are impulsive and usually make a decision to stay on a site within the first few seconds. "Website design is like a shop interior. If the shop looks poor or like hundreds of other shops the customer is most likely to skip to the other site. Hence we have designed the project to provide the user with easy navigation, retrieval of data and necessary feedback as much as possible.

In this project, the user is provided with an e-commerce web site that can be used to buy Products online. To implement this as a web application we used ASP.NET as the Technology. C#, SQL was the language used to build this application. SQL Server was used as back-end database since it is one of the most popular open source databases, and it provides fast data access, easy installation and simplicity. The building of the project has given me a precise knowledge about how ASP.NET is used to develop a website, how it connects to the database to access the data and how the data and web pages are modified to provide the user with a Computer Shop Management application.

It has been a great pleasure for me to work on this exciting and challenging project. This project proved good for me as it provided practical knowledge of not only programming in ASP.NET and C#.NET web based application and no some extent Windows Application and SQL Server, but also about all handling procedure related with **"The Computer shop management"**. It also provides knowledge about the latest technology used in developing web enabled application and client server technology that will be great demand in future. This will provide better opportunities and guidance in future in developing projects independently.

BENEFITS:

The project is identified by the merits of the system offered to the user. The merits of this project are as follows: -

- It's a web-enabled project.
- This project offers user to enter the data through simple and interactive forms. This is very helpful for the client to enter the desired information through so much simplicity.
- The user is mainly more concerned about the validity of the data, whatever he is entering. There are checks on every stages of any new creation, data entry or updation so that the user cannot enter the invalid data, which can create problems at later date.
- Sometimes the user finds in the later stages of using project that he needs to update some of the information that he entered earlier. There are options for him by which he can update the records. Moreover there is restriction for his that he cannot change the primary data field. This keeps the validity of the data to longer extent.
- User is provided the option of monitoring the records he entered earlier. He can see the desired records with the variety of options provided by him.
- From every part of the project the user is provided with the links through framing so that he can go from one option of the project to other as per the requirement. This is bound to be simple and very friendly as per the user is concerned. That is, we can sat that the project is user friendly which is one of the primary concerns of any good project.
- Data storage and retrieval will become faster and easier to maintain because data is stored in a systematic manner and in a single database.
- Through these features it will increase the efficiency, accuracy and transparency,

LIMITATIONS:

There are some limitations for the current system to which solutions can be provided as a future development:

1. The system is not configured for multi- users at this time. The concept of transaction can be used to achieve this.
2. The Website is not accessible to everyone. It can be deployed on a web server so that everybody who is connected to the Internet can use it.
3. Online Payment & delivery of Product is not done.

Chapter 8

FUTURE IMPROVEMENT

As for other future developments, the following can be done:

- The Administrator of the web site can be given more functionality, like looking at a specific customer's profile, the booked order that have to be reordered, etc.
- Online Payment and Delivery Mode.
- Web Hosting
- It is just a beginning; further the system may be utilized in various other types of auditing operation viz. Network auditing or similar process/workflow-based applications...
